(A) Fine grid + caliber-1 aggregates
strong x (thick), weak $y = \varepsilon$ (thin)
affinity is large across strong x-edges
$\Rightarrow$ 2:1 pairs along x
(B) Slow mode after pointwise GS
smooth in x, oscillatory in y
GS smooths strong x; leaves x-smooth error,
any y-frequency ($\sqrt{n}$ such modes)
(C) Coarse grid = semicoarsened
$P/2 \times P$: half the x-points, all y-layers
every y-layer kept at full resolution
$\Rightarrow$ all $\sqrt{n}$ slow modes representable
